

Changing remembered history can change the next decision

Diverse partners + influence: transplant from a donor whose faster goal is opposite to the recipient's.

Same physical situation and input; first learned allocation (v1: $t=0$, v2: $t=1$). Positive = closer to donor's faster-goal assignment.

Dots/bars: mean and 95% seed bootstrap; small dots: 5 seed means (6 held-out histories each). Full-state swaps also change other memories.
